II. RELATED WORK

A study on the Colombian chocolate industry represents the first application of a social life cycle assessment (S-LCA) to cover both cocoa cultivation and chocolate manufacturing [1]. A study on selective, hedonic deprivation found that restricting chocolate intake for two weeks increased state chocolate craving, but only in individuals who already had high trait chocolate craving [2]. Research suggests that the health benefits of moderate cocoa or dark chocolate consumption, which include cardiovascular and cognitive advantages, likely outweigh the risks associated with its high energy density [3].
